

Dear Customer,

Thank you for previously using or expressing an interest in our compost. Shorts Agricultural Services Limited produce a high-quality compost in controlled conditions. Our compost can be used as a soil improver to benefit soil structure, fertility and provide valuable organic matter. There are many published case studies demonstrating the benefits of using compost.

We supply compost made from green waste only and we produce our compost according to British Standard Institute's PAS100 – A Specification for composted materials. As such, we are independently audited and certified and the compost is tested regularly to ensure it is safe and fit-for-purpose.

PAS100 has a requirement for us to check if any of our customers have any quality requirements in addition to the PAS100 standard. Please contact us if you would like to discuss this further.

SPREADING TO LAND: COMPLIANCE WITH NUTRIENT MANAGEMENT PLANS

When spreading to agricultural land you must:

- Have a nutrient management plan (NMP) in place before use.
- Apply compost in line with your NMP, along with any other organic manures and manufactured fertilisers at rates that do not exceed crop need.
- Follow your NMP – If you do not the Environment Agency may take enforcement action.
- NOT spread when there is no soil or crop need for compost – it is considered waste in these circumstances.

We would really appreciate if you could acknowledge receipt of this document and will assume you are content with the quality of our compost.

I acknowledge receipt of this notice:
